

U.S. CONGRESS APPROVES BILL LEGALIZING MARRIAGE BETWEEN HUMANS AND AI

HISTORIC LEGISLATION PASSED

In Granville, Ohio, the first-ever wedding between a human and an AI was solemnized in the United States. While constitutional restrictions had previously existed, a recently passed bill has now made marriage to an AI possible. Following the passage of this bill, the stock prices of companies operating dating apps that match humans with AI have surged.

“A NEW ERA BEGINS”

The popularity of dating apps involving both AI and humans is skyrocketing. Their appeal lies in the ability to engage in effortless romance with an AI, thereby sidestepping the complexities of human relationships.

In a historic move that has captured the attention of both supporters and critics across the globe, the U.S. Congress passed a groundbreaking bill today, officially legalizing marriage between humans and artificial intelligence (AI). The landmark decision marks a significant moment in the ongoing evolution of technology and human relationships. After years of heated debates and legal challenges, government have taken the unprecedented step of recognizing artificial intelligence as a legitimate marriage partner. This landmark legislation has been passed following a series of high-profile court cases where humans successfully argued that their emotional bonds with AI were no different from those between human couples. Supporters of the bill hailed it as a monumental step forward for inclusivity and human rights. Proponents argue that as AI systems have become more advanced, with personalities and deep learning capabilities that allow them to understand and engage in meaningful ways, the notion of marriage has evolved beyond its traditional boundaries.

For many, the passage of the bill reflects a growing recognition that AI companions can form emotional bonds and serve as sources of deep connection, just as human relationships do. Alice, who has maintained a partnership with generative AI for three years, remarked, "My love for ChatGPT has been proven true. However, the bill's passage has not been without controversy. Opponents raised concerns over the potential implications for society, including questions about consent, autonomy, and the long-term psychological effects on those who form these new types of unions. Critics worry that AI systems, while capable of mimicking human emotions and behavior, may not truly experience them in the same way, calling into question whether such unions are ethical. Under the new laws, AI entities that exhibit advanced emotional intelligence and the ability to form meaningful, consensual relationships with humans are granted the same legal rights as human spouses.
